Northstar SaaS — Business Performance Analysis

Project Background

Northstar is a B2B SaaS company offering workflow automation tools to businesses on four subscription plans: Starter, Growth, Professional, and Enterprise.

Business Problem

Three concerns were raised by the Head of Operations and Finance Director:

- A rising volume of overdue invoices going unaddressed
- Increasing churn with no clear understanding of which customers are at risk or why
- Unknown whether product usage patterns differ between retained and churned customers

Objective

Analyse two years of business data (January 2024 – December 2025) across eight tables to uncover insights and deliver actionable recommendations across six business areas.

Business Areas Covered

- Customer growth and acquisition
- Revenue and collections
- Customer retention and churn
- Product engagement and usage
- Sales pipeline performance
- Customer support operations

Key Findings

- $2.84M in overdue invoices identified, with 10,666 linked to active customers
- ~31% churn rate consistent across all segments — points to a product issue, not acquisition
- Churned customers show 48% less activity in their final 90 days — early warning signal exists
- December 2025 churn spike of 2,430 subscriptions requires validation before actioning
